Does it actually matter what you pack in your carry-on versus your checked luggage? Not always, but there are still a few pointers you might want to keep in mind. I advocate for sticking to a carry-on when possible (even for two-week trips). However, it's not always possible, whether due to weather. Why are all lithium-ion batteries recommended to be transported in carry-on and not checked bags? If my battery is damaged or recalled can I travel with it? Is there a limit to the number of lithium-ion batteries or devices I can carry? How do I determine a lithium-ion battery's watt hours (Wh)?

When traveling by air, understanding the airline regulations for carrying battery packs in luggage is crucial for a hassle-free journey. Airlines impose specific rules on transporting battery packs due to their potential fire hazard. Generally, most airlines permit battery packs in carry-on luggage. Passengers can bring lithium-ion batteries, including power banks and charging cases, in carry-on baggage only. Larger batteries (101-160 watt-hours) or lithium metal batteries (2-8 grams) are permitted with airline approval. Always check with your airline before flying to confirm their specific regulations. Non-rechargeable batteries are limited to 2 grams of lithium content. Always check airline regulations for any restrictions before flying. It is also important to know that each passenger can bring a maximum of two power banks on a plane. Always check the power limits and rules outlined by your airline.
